

1 Q. Newfoundland and Labrador Hydro Cost of Service Methodology Review  
2 Application, Pre-Filed Testimony of Andrew McLaren, August 5, 2019, Page  
3 19, Lines 13-19.

4 *“The Christensen Associates report notes the equivalent peaker method was*  
5 *reviewed in the 1992 methodology review and rejected by the Board for*  
6 *reasons of computational challenge and plant vintage and valuation issues.*  
7 *The Christensen Associates report states those issues apply with less force*  
8 *now, since the peaking unit computations pertain to a plant of current vintage.*  
9 *However, in InterGroup’s view, these vintage issues will also affect calculations*  
10 *in the future. It seems likely the Board’s previously expressed concerns will be*  
11 *an issue in subsequent COS studies if the equivalent peaker method is*  
12 *adopted.”*

13 Is it InterGroup’s view that applying the equivalent peaker methodology to the  
14 singular Muskrat Falls Project at this time poses the same challenges as  
15 applying the methodology to all of Hydro’s generating facilities of various  
16 vintages as proposed in 1992? If so, please explain. If not, why not?

17 A. Applying the equivalent peaker methodology to Muskrat over time will give rise to  
18 vintaging issues, in that older vintage plants (such as Bay D’esperoir) will be costed  
19 as if demand is a relatively important factor in NLH’s economic make-up, while the  
20 newest plant (Muskrat) will be costed as if demand is at best a minor component  
21 of NLH’s economic profile. In fact, post-Muskrat, all evidence is that demand will  
22 be the driving factor causing investment, and will require careful price signals to  
23 help manage (while at the same time, energy will be a relatively low value product  
24 tied to export markets). For this reason, vintaging NLH’s plants to make the newest  
25 plants be even more energy-focused than Bay D’Espoir is a challenge. The issue  
26 is only partly a computational challenge, as set out in the preamble to the question,  
27 but moreso an analytical challenge of being out-of-sync with ongoing system  
28 planning and operation constraints, which undermines the purpose of a cost of  
29 service study.
