Board of Commissions of Public Utilities
120 Torbay Road, P.O. Box 2140
St. John's, NL A1A 5B2

Attention: Jo Galarneau
Executive Director and Board Secretary

Dear Ms. Galarneau:

Re: Newfoundland and Labrador Hydro –
Reliability and Resource Adequacy Study Review
- Requests for Information

Further to the above-captioned, enclosed are the Consumer Advocate's Requests for Information numbered CA-NLH-061 to CA-NLH-067.

If you have any questions regarding the enclosed, please contact the undersigned at your convenience.

Yours truly,

Stephen Fitzgerald, KC
Counsel for the Consumer Advocate

Encl.

IN THE MATTER OF

the *Electrical Power Control Act*, 1994,
SNL, 1994, Chapter E-5.1 ((the “*EPCA*”)
and the *Public Utilities Act*, RSNL 1990,
Chapter P-47 (the “Act”), as amended,
and regulations thereunder;

IN THE MATTER OF Newfoundland and
Labrador Hydro’s Reliability and Supply
Adequacy Study.

**CONSUMER ADVOCATE
REQUESTS FOR INFORMATION
CA-NLH-061 to CA-NLH-067**

Issued: November 15, 2024

1 CA-NLH-061 (Reference Technical Conference 3 Presentation, slide 47) The graph shows
2 available LIL capacity for Island use vs. Island load.

- 3
- 4 a) Is the installed generating capacity at Muskrat Falls 824 MW?
- 5
- 6 b) How much of the Muskrat Falls generating capacity (ignoring LIL
7 limitations) is available to meet Island load requirements after
8 accounting for other commitments such as those to Nova Scotia?
- 9
- 10 c) Does the graph show that at Island loads of 1800 MW, the Muskrat Falls
11 generating capacity available to supply Island needs is about 450 MW?
- 12
- 13 d) In light of LIL limitations, what is the maximum Muskrat Falls capacity
14 available to the Island? In other words, at what load level in the chart
15 does the graph become horizontal?
- 16
- 17 e) In the chart, as Island load increases from 1600MW to 1800MW, the
18 net LIL amount available appears to increase from approximately
19 400MW to 450MW, which implies that only an extra 50MW is available
20 via the LIL to meet the 200MW increase in island load. (i) Please
21 explain why the relationship is not closer to one-to-one. (ii) For the
22 figures given, where would the additional needed capacity of 150MW
23 come from and at what cost? (iii) In light of the relationship between
24 Island load and net LIL availability, what are the implications for the
25 calculation of the marginal cost of capacity and the marginal cost of
26 energy? (iv) Has Hydro's most recent marginal cost update taken the
27 relationship in the chart into account?
- 28
- 29 f) Is the amount of Muskrat Falls generating capacity available to supply
30 the Island limited by the amount of load available on the Island for load
31 shedding? If so, at an Island load of 1800 MW and a LIL transfer
32 capacity of 450 MW, how much load would have to be available for
33 shedding?
- 34
- 35 g) Please describe Hydro's load shedding scheme. What is the total amount
36 of load available for shedding on the Island, how does the NL System
37 Operator know how much load is available for shedding at a given point
38 in time and how is load shedding rotated among customers?
- 39
- 40 h) Is load shedding considered to be a smart grid application? Would the
41 management, allocation and efficiency of the load shedding regime be
42 improved if Newfoundland Power had smart meters? Why or why not?

- 1 i) What options are available to Hydro to increase reliable transfers of
2 Muskrat Falls generation to the Island besides making reliability
3 improvements to the existing line? For example: i) Could Hydro and
4 Newfoundland Power increase the amount of load available for
5 shedding? ii) Could Hydro build an additional transmission line between
6 Muskrat Falls and the Island using the existing, or new converter
7 stations? iii) Could Hydro split the poles of the existing LIL HVDC line
8 onto separate towers with fall-free spacing between the towers? iv)
9 Other options?
10
- 11 j) If Hydro were able to reliably transfer the full 824 MW of Muskrat Falls
12 generating capacity to the Island rather than only 450 MW (assuming
13 1800 MW demand on the Island), would this delay the need for the CTs
14 and Bay d'Espoir Unit 8 in the Reference Plan until after 2035, and if
15 so, what cost savings would result?
16

17 CA-NLH-062 In the resource adequacy study:

- 18
- 19 a) Is Hydro considering transmission separately from generation?
20
- 21 b) Did Hydro follow an approach that considers: i) enhancements to the
22 existing system such as maintenance/refurbishment, smart grid and
23 behind-the-meter applications (time-varying rates, demand control,
24 conservation, customer-owned generation, customer-owned battery
25 storage such as electric vehicles, etc.), ii) new generation, and iii)
26 new/enhanced transmission?
27
- 28 c) Can transmission be an alternative to generation? For example, instead
29 of building new CTs on the Island, could a new transmission line be
30 built from Muskrat Falls generation to the Island?
31
- 32 d) In the absence of smart meters, can behind-the-meter applications thrive
33 and make a meaningful contribution to the province's energy supply?
34

35 CA-NLH-063 With respect to the transmission supply to the Avalon Peninsula:

- 36
- 37 a) Please describe each transmission line that crosses the isthmus to the
38 Avalon Peninsula including line designation, end points, voltage level,
39 transfer capacity, whether a single or double circuit line (with both
40 circuits sharing a tower), and the distance from the line to the next
41 closest line at the nearest point where it crosses the isthmus to the
42 Avalon Peninsula.

- 1 b) Please describe the transmission criteria used to assess the available
2 capacity on the Avalon Peninsula. For example, does Hydro use an n-1
3 criterion assuming i) the loss of a single transmission line that crosses
4 the isthmus to the Avalon Peninsula, ii) the loss of all transmission lines
5 crossing the isthmus to the Avalon Peninsula, or iii) something else?
6
7 c) What types of events does Hydro plan for that might lead to the loss of
8 transmission to the Avalon Peninsula?
9

10 CA-NLH-064 (Reference Technical Conference 2 Presentation, slide 36) It is noted that
11 transmission upgrade costs are projected to be \$150 million and include a
12 new transmission line from Western Avalon to Soldiers Pond and dynamic
13 line rating technology (LineVision).
14

- 15 a) Please explain why this expenditure is needed including all
16 assumptions, reliability criteria applied, and expected improvement
17 resulting from the \$150 million expenditure.
18
19 b) Does this expenditure relate to an n-1 or n-2 planning criterion. If n-2,
20 why?
21

22 CA-NLH-065 (Reference Technical Conference 1 Presentation, slide 47) It is noted that
23 acquiring firm imports from New Brunswick, Nova Scotia and New
24 England are not feasible in the near term.
25

- 26 a) Why are firm imports not available in the near term? What are the
27 limiting factors?
28
29 b) Are firm imports expected to be available in the mid- to long-term, and
30 if so, what is expected to change between the near- and mid-terms?
31
32 c) Are there potential transmission reinforcements available in other
33 eastern Canadian provinces or the northeastern United States that would
34 remedy this situation? If so, please identify the possibilities and any
35 actions being taken to pursue such possibilities.
36
37 d) It is understood that generating capacity is short on the Island, New
38 Brunswick and Nova Scotia. Studies relating to regionalization of power
39 systems (for example, the formation of Regional Transmission
40 Organizations in the U.S.) generally show economic benefits because it
41 enables economic dispatch over a broader region, a reduced need for
42 capacity reserves and optimized generation and transmission planning
43 (to name a few). i) Have any such studies been undertaken in Eastern
44 Canada? If so, what were the results? ii) What would it take to get such

1 a study underway? iii) Is Hydro considering such a study as part of the
2 Resource Adequacy Plan?
3

4 CA-NLH-066 In developing the 2024 Resource Adequacy Plan, did Hydro determine that
5 procurement of wind energy is less costly than investing in its own wind
6 generating capacity? Please provide copies of any related in-house analyses
7 or consultant studies.
8

9 CA-NLH-067 With respect to LIL unavailability:
10

- 11 a) To what extent is the prospect of LIL unavailability for up to six weeks
12 during the coldest part of the winter a determinant in the Minimum
13 Investment Plan? Has Hydro determined the probability of such a
14 shortfall event? If the LIL were unavailable for up to two weeks, how
15 would the Minimum Investment Plan be affected?
16
17 b) What types of events does Hydro plan for that might lead to the loss of
18 a single pole on the LIL?
19
20 c) What types of events does Hydro plan for that might lead to the loss of
21 both poles on the LIL?
22

DATED at St. John's, Newfoundland and Labrador, this 15th day of November, 2024.
